

AMENDMENTS TO THE CLAIMS:

Please amend the claims as follows:

1. (currently amended) An electro-optical device having at least one photosensitive element and at least one switching element with at least one layer of amorphous silicon on which an ITO (indium tin oxide) layer is provided, said at least one photosensitive element and said at least one switching element being also provided with and a at least one SiN layer near the said ITO layer, wherein said ITO layer is deposited prior to the said SiN layer and an intermediate layer of silicon oxide is provided between the said ITO layer and the said SiN layer in such a manner that said at least one switching element is completely shielded during manufacture.

2. (previously presented) The electro-optical device of claim 1, wherein the electro-optical device is a fingerprint sensor.

4. (currently amended) A method for improving the optical and electrical properties of an ITO layer and thereby the quality of an electro-optical device, comprising the steps of:

providing an electro-optical device having at least one photosensitive element with at least one layer of amorphous silicon;

depositing a doped ITO layer on said at least one layer of amorphous silicon; and

providing an intermediate layer of silicon oxide between

said doped ITO layer and an said SiN layer provided by means of chemical vapor deposition.

5. (previously presented) The method of claim 4, wherein said intermediate layer of silicon oxide is provided prior to said step of providing said SiN layer.

6. (currently amended) The method of claim 5, wherein said SiN layer is provided by means of chemical vapor deposition so that said doped ITO layer is protected during manufacture.
